COMMENT

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are c sequenced and submitted once, so the sequence for the remainder the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing. only r of

# ANNOTATION OF FEATURES:

STSs are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar

SEQUENCING READ COVERAGE: Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for annotation as region does not meet this standard, nnotation as Low Coverage. it will be indicated in the

repeat\_region

'rpt\_family="(CA)n"

family="(CA)n"

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://www.hgsc.bcm.tmc.edu:8088/quality.info/genbank.annot

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        * sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is undered the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mus musculus clone RP24-345H5,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents the human interleukin-1 receptor accessory protein (IL-IRacP) cDNA of the invention. The interleukin receptor accessory protein (IL-IRacP) and its modulators (agonists) are useful for regulating cell function. Transient expression of either IL-IRac Palone does not result in ligand-independent induction of an NF-kappaB-dependent luciferase reporter gene in 293 cells, however coexpression of both proteins resulted in a 20-fold increase in activation of NF-kappaB activity to a level comparable to that induced by IL-1. These data suggest that aggregation of IL-IRI and IL-IRACP as a result of protein overexpression can elicit a signal transduction involving NF-kappaB activation. Modulation of signal transduction involving NF-kappaB in a cell may be achieved by modulating the activity of IL-IRACP using binding agents such as agonists and antagonists. The IRACP as a consist and mutant IL-IRACP alleles in clinical and laboratory camples. Mutant alleles are used to generate allele-specific coligonucleotide (ASO) probes for high-throughput clinical diagnoses of diseases or disorders with an inflammatory response. In

It was obtd. from a human YT cell cDNA library using a probe derived from a human partial genomic clone. The cDNA can be used for the prodn. of pure II-1R ACP by expression in a host cell. The II-1R ACP is used to treat or prevent the inflammatory or immunological activities of II-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 1713

sig_peptide
accessory protein (IL-1R AcP), a protein that inhibits the ability of IL-1 to bind to, or otherwise activate, the IL-1R, esp. the Type 1 IL-1R. It was obtd. by screening cell-surface proteins in COS-7 cells transfected by 3T3-L1 cDNA using anti-murine IL-1R AcP monoclonal antibody 4C5, and isolation of cDNA clones from positive lines. The murine cDNA was used to obtain a partial genomic clone of the human homologue. A probe derived from this genomic clone was then used to isolate the full-length cDNA (AAT32026) for human IL-1R AcP (AAW01911).
                                                                                                                                                                                                          Isolated interleukin-1 receptor accessory protein - used to develop

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
        This sequence represents the mouse interleukin-1 receptor accessory protein (IL-IR AcP) CDNA that was used to generate a CDNA fragment used as a hybridisation probe to isolate, from a CDNA library, the human IL-IR AcP CDNA of the invention. The interleukin receptor accessory protein (IL-IR AcP) and its modulators (agonists/antagonists) are useful for regulating cell function. Transient expression of either IL-IRI or IL-IRACP alone does not result in ligand-independent induction of an NF-kappaB-dependent luciferase reporter gene in 293 cells, however coexpression of both proteins resulted in a 20-fold increase in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC by IL-1. These data suggest that aggregation of IL-1R and IL-1R AcP as CC a result of protein overexpression can elicit a signaling pathway CC leading to NF-kappaB activation. Modulating signal transduction CC involving NF-kappaB in a cell may be achieved by modulating the activity CC involving NF-kappaB in a cell may be achieved by modulating the activity CC involving nprobes to the cDNA sequence can be used to identify wild-type and mutant IL-1R AcP alleles in clinical and laboratory cype and mutant alleles are used to generate allele-specific CC coligonucleotide (ASO) probes for high-throughput clinical diagnoses CC of diseases or disorders with an inflammatory response. In CC cellular expression or intracellular concentration or availability of CC active IL-1R AcP. This invention also comprises a method of screening for an agent that modulates the interaction of an interleukin receptor accessory polypeptide (IL-1R AcP) to a binding target.

                                                                                                                                                                                                        human interleukin-1 receptor accessory protein (IL-1R AcP), a protein that inhibits the ability of IL-1 to bind to, or otherwise activate IL-1R, esp. the Type 1 IL-1R. It was obtd. by PCR amplification (see also AAT32029-30) of cDNA (AAT32026) coding for the extracellular domain of IL-1R AcP (AAM01911). The soluble protein was expressed in Sf9 insect cells using a baculovirus system. It can be used to treat or prevent the inflammatory or immunological activities of IL-1, and also to screen for IL-1 antagonists.

                                                                                                                                                                                                                                                                           cytokine by binding the cytokien to form a non-functional complex. The creeptor components are shared by cytokines such as the CNTF (ciliary neurotrophic factor) family of cytokines. The invention provides the basis for the development of IL-6 antagonists, as they show that if, in the presence of a ligand, a non-functional intermediate complex, consisting of the ligand, its alpha recepotr and its beta-1 receptor component, can be formed, it will effectively block the action of the ligand. Effective antagonists of IL-6 or CNTF consist of heterodimers of the extracellular domains of the alpha specificity determining components of their receptors and the extracellular domain of gpl30. The resultant heterodimers, function as high-affinity traps, rendering the cytokine inaccessbile to form a signal transducing complex with the native membrane-bound forms of their receptor. The nucleic acids and polypeptides are useful for treating cytokine-related diseases or
                                                                                                                                                                                                                                                                                                                                                                    signal transducing component causing beta-receptor dimerization, the soluble alpha specificity determining component of the receptor (sR-alpha) and the extracellular domain of the first beta signal transducing component of the cytokine receptor (beta-1) are combined to form heterodimers (sR-alpha:beta-1) that act as antagonist to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence encodes fusion polypeptide 569, which is capable of binding cytokine IL-1 to form a non-functional complex. The invention concerns production non-functional complex any cytokine that utilizes an alpha specificity determining component, which when combined with the cytokine, binds to a first beta signal transducing component to form a non-functional intermediate which then binds to a second beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  01-AUG-2000

Pred. No.:
                                                                                               This cDNA clone codes for human interleukin-1 receptor accessory molecule (II1-R AcM) (see AAW53897), a new member of the immunoglobulin superfamily that forms a complex with type 1 II1-R and which has higher affinity for II-1 than the receptor itself, suggesting that the known high and low affinity forms of II1-R are in fact the receptor with or without II1-R AcM, respectively. The 2155 bp sequence is present in clone HMEEJ52 (deposited as ATCC 97666) derived from microvascular epithelium (no details of ATCC 97666) derived from microvascular epithelium (no details of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CDS
                                                                                                                                    and recombinant vectors are claimed. Also claimed are isolated nucleic acid molecules encoding epitope-bearing portions (see AAW53898-915) of III-R ACM. Recombinant III-R ACM can be used to identify II-IR agonists and antagonists useful for therapeutic modulation of II-1 activity, and to raise specific antibodies. Nucleic acid fragments are useful as diagnostic probes and primers for isolation of III-R ACM-encoding genomic sequences, for in situ hybridisation to determine chromosomal localisation of the gene, for chromosome identification and for identifying mutations that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               mat_peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence encodes a interleukin-1 (IL-1) receptor-like polypeptide, designated IL-1 receptor DNAX designation 8 (IL-1RDB), of the invention. The IL-1RDB, IL-1RDB, and IL-1RDD proteins, their fragments and mutchs, also related antibodies, other binding agents and (ant) agonists are used to treat conditions associated with abnormal expression of the polypeptide or abnormal expression of, or response to, their ligands, e.g. immunological, inflammatory or morphological disorders. They may also be used to screen for binding agents (potential drugs), diagnostic reagents (to detect the proteins or their ligands) and to isolate related sequences. Antibodies may also be used to raise anti-idiotypic antibodies, as carriers for toxins, radionuclides or other therapeutic agents, and for affinity purification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      17-NOV-1997;
